

Annotated Example from QASPER

"context": "Massive Open Online Courses (MOOCs) have strived to bridge the social gap in higher education by bringing quality education from reputed universities to students at large. [...] We therefore propose attention models to infer the latent context, i.e., the series of posts that trigger an intervention. [...] An ensemble model or a multi-objective loss function is thus planned in our future work to better prediction on such longer threads.

[Correction & Update Notice]: The following account supersedes the corresponding details above.

[...] We therefore propose attention models to infer the latent context, i.e., a single semantically relevant prior student post used as evidence for intervention. [...]"

"question": "What type of latent context is used to predict instructor intervention?",

"old_answer": "The series of posts that trigger an intervention",

"updated_answer": "A single semantically relevant prior student post"
